Effect of Hypothermia Therapy After Outpatient Cardiac Arrest Due to Ventricular Fibrillation.
Department of Emergency and Critical Care Medicine, Kitasato University School of Medicine.

Overview: The positive effect of hypothermia therapy on patients who have suffered from cardiac arrest. Salvaging patients from circulatory collapse is a pivotal task, but it is unclear whether additional hypothermia can practically contribute to an improvement in the neurological outcome.

Conclusions: Hypothermia therapy is very useful for treating patients who have had an out-of-hospital cardiac arrest; it should be induced rapidly and smoothly.
